SALES ANALYSIS

Business Insights Report | Power BI dashboard project

TOTAL SALES	TOTAL QUANTITY	PROFIT MARGIN	TOTAL CUSTOMER ORDERS
109.47M	288K	32.65%	100K

Key Business Findings

1. The business generates 109.47M in sales at a 32.65% profit margin.

The dashboard reports 35.74M total profit against 109.47M in sales. This indicates a substantial profit contribution overall, while margin and profit should be monitored together as the business grows.

2. Revenue is distributed fairly evenly across sales channels.

Channel sales range from 26.88M (Retail Store) to 27.75M (Online), a spread of about 0.87M or less than 1% of total sales. No single channel dominates, so performance improvements can be tested across all four channels rather than relying on one.

3. Accessories are the leading category by a clear margin.

Accessories contribute about 36M in sales and 11.8M in profit, ahead of Home Appliances at 22M sales and 7.3M profit. Accessories are the strongest current category in the dashboard and merit attention in availability, merchandising, and campaign planning.

4. Sales were broadly stable from 2021 to 2025, while 2026 is materially lower in the displayed view.

Annual sales shown for 2021–2025 sit around 18.7M–19.7M; the 2026 point is approximately 14.2M. Because the dashboard does not establish whether 2026 is a complete year, this should be treated as a period-coverage question before concluding that sales have declined.

5. Customer sales are spread across four customer types.

VIP customers account for 29.62M (27.06%) of sales; New, Returning, and Corporate each contribute roughly 24%–24.4%. The mix is diversified, so customer strategy should retain VIP value while also improving acquisition and repeat purchasing.

6. Returning orders represent about one quarter of customer orders.

The dashboard shows 100K total customer orders, 24.25K new-customer orders, 24.51K returning-customer orders, and a 24.51% returning rate. This gives the business a measurable baseline for repeat-order performance, although the dashboard alone does not show cohort retention or customer lifetime value.

7. Product and sales-rep performance is relatively balanced among the displayed leaders.

The five leading products each generate approximately 7.32M–7.70M in sales, with displayed profit margins clustered around 32.70%–32.76%. Ahmed Ali leads the sales-rep table at 17.27M sales and 5.64M profit; these figures can support benchmarking, but do not by themselves explain why performance differs.

Business Recommendations

1. Validate the 2026 reporting period. Confirm the data refresh date and whether 2026 is year-to-date; compare equivalent periods before using the apparent decline in forecasts or performance reviews.

2. Prioritize category-level planning for Accessories. Review stock availability, pricing, and campaign results for Accessories while protecting profitability; use Home Appliances as the next category for targeted growth tests.

3. Build a repeat-customer improvement plan. Track returning-order rate by month and customer type, then test retention offers or personalized follow-ups. Measure results against the current 24.51% returning rate and 24.51K returning orders.

Project Scope & Tools

Reviewed evidence: six dashboard screenshots covering Overview, Revenue, Customer, Product, Sales Representative, and Channel analytics. Tools listed for the project: Python, Pandas, Excel, and Power BI.

Data note: Findings are based on values visible in the supplied dashboard screenshots. Some figures are rounded in charts; the 2026 sales point may represent a partial year and has not been treated as a confirmed year-over-year decline. No underlying transaction file was provided for independent reconciliation.
